## Tabletop Baggers

### Manual Tabletop Bagger/Sealer

The T-200 uses our Pre-Opened Bags on Rolls. Simply pull the bag into the loading and sealing position to allow the bag to blow open. Insert the product and press a foot-switch or guard switch to seal the bag then pull the next bag into position. The bags remain connected and can be manually separated at the perforated line.

- Dwell time and heat controls
- Universal funnel
- Adjustable load shelf
- Quick roll change
- Easy threading of bags
- Foot switch included

Model #	Bag Size	Power	Air	Bags/Min	Weight	Dimensions
T-200	2" x 2" - 11" x 16"	110V/60hz	.5 cfm/40psi	5-15	50 lbs	19.5"x16"x21.5"

### Manual or Semi-Automatic Tabletop Bagger

Add automation with the T-275 Automatic Tabletop Bagger to increase packaging speed. This machine operates exactly like the T-200, but the machine automatically and quickly feeds the bag into the loading/sealing position and blows it open before you insert the product. The next bag is then indexed into position and blown open, ready to receive the next product. It is a good choice for lower-volume packaging of a wide variety of products. The bags remain connected and can be separated at the perforated line.

- Quick roll change and easy threading of bags
- 4 color touch screen with manual operation or automatic "paced" operation for faster cycle speeds.
- Maximum pass through height is 2.75"
- Foot switch included

Model #	Bag Size	Power	Air	Bags/Min	Weight	Dimensions

## Pressure Overflow Micro Filling Machine

Containers enter the filling area in groups. When the last container in the group passes the mounted counting sensor, a pneumatic gate will engage and prevent other containers from interfering in the filling process. A product aligner engages the necks of each container, centering it under each fill nozzle, and the nozzles will lower into the opening of each container. Once seated on the opening of the bottles, the fill tubes will be opened and as air exits the container, product will flow in from the product tank. The fill level in each container is controlled by the position of the vent tube, so it is a fill-to-level principle.

## CM-20F & CM-20B Side Seal Machines

### High Speed - Continuous Motion - 3 Servo Drive Side Seal Machines

Manufactured using the most modern technology, the new CM-20F (flighted infeed) or CM-20B (belted infeed) are extremely versatile machines capable of running a wide variety of industrial or consumer products. With servo control these machines are capable of speeds up to 80PPM. The specialized infeed allows precise seam placement and tight bag tolerances allowing packages to meet USPS postal regulations for mailing.

The infeed servo motor drives the 6ft lugged infeed conveyor which brings the product directly into the center folded film. This feature allows for additional film savings of 20% over conventional side seal machines. The product then goes onto the servo controlled side seal conveyor and finally passes through the servo controlled takeaway conveyor. The continuous motion sealing function means the belts do not stop which allows for faster speeds and also prevents product shingling or slipping.

- 3 Servo drive technology
- Speeds up to 80 PPM

- Multiple languages
- Adjustable Height Cross Seal Bar
- Teflon coated rotary side seal wheel

**Steam Shrink Tunnels**

**Steam Shrink Tunnels**

The Steam Shrink Tunnels are designed to efficiently shrink full body shrink sleeves on almost any container type and almost any shrink film material. The low pressure steam tunnel distributes steam evenly with an integrated steel tube design. There are steam jet tubes in each section of the tunnel which are adjustable for both height and steam output. The shell of the tunnel is constructed of #304 Stainless Steel and there is also a stainless steel water collecting plate to collect the condensated water. The stainless steel, water-proof design makes it easy to clean and maintain.

This table top series is used for sealing heat sensitive film to pre-formed trays or containers for a tamper evident stay-fresh seal. It will seal and die cut the film around the container for an attractive look. The temperature and sealing time can be set depending on the type of tray and material being sealed. When you load the tray a sensor in the machine detects the tray and automatically advances the tray into the sealing area to initiate the sealing cycle once inside the pneumatic cylinder moves downward to apply the seal pressure and at the same time die cuts around the tray to make a nice clean cut around the tray leaving no scrap, the sealing fixture will then move outward where the tray may be removed. The film is then automatically advanced for the next package. This machine is designed to ensure that each compartment of the tray is separately sealed. Easy changeover of tooling allows operator to run different trays easily.

### Heavy Duty Vacuum Bags

**Application:**

285 Series is a cost-effective FDA approved film used extensively for demanding vacuum applications found in a variety of industries. The clarity allows it to be used in Price, as well as, institutional duties. The films extensibility (ability to stretch) allows it to conform to unique product geometry. Low oxygen transfer rate, high impact resistance, and its low cost make it popular with meat, fish, nuts, dried fruit, jerky, and snack products.

**Converting:**

It can be converted in many ways: 2-seal pouch, 3-seal pouch, or a re-closeable zippered pouch. It can also be surface printed (flexo line or flexo process).

*These bags are commercial grade and will not work on home vacuum systems.*

- Nylon/Poly COEX Vacuum Bags - Nominal 3 mil
- 3-seal pouches with 3/8" seal dimension
- Inner packs = 250 quantity (bagged)
